

Influenza Surveillance Report

Division of Epidemiology - Disease Surveillance and Investigation
District of Columbia Department of Health

2013-2014 Influenza Season Week 50 (December 8, 2013 – December 14, 2013)

(All data are preliminary and may change as more reports are received)

SUMMARY

- 9 case of Influenza was reported by hospitals during this reporting period.
- Zero pediatric-deaths associated with Influenza were recorded during this reporting period.
- For the 2013-2014 Influenza season to-date, 79 positive Influenza cases have been reported.

INFLUENZA SURVEILLANCE FROM HOSPITALS & AMBULATORY CARE FACILITIES

District of Columbia hospitals and laboratories report detailed information on cases of Influenza on a daily basis. However, in accordance with CDC guidelines, only Influenza-associated deaths in cases <18 years of age and Novel Influenza A infections are reportable. Please note that data from hospitals include all cases received by participating hospitals, regardless of residency.

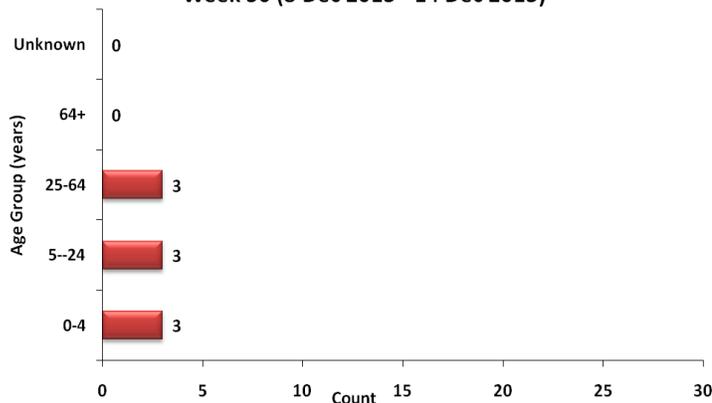

The table below summarizes weekly and cumulative cases of Influenza for the 2013-2014 Season. Data are also presented by age group and by number of cases reported weekly. During week 50 (December 8, 2013– December 14, 2013), there were 9 new cases of Influenza reported. To date, the District has received 79 positive cases reported by hospitals.

Surveillance of Influenza Cases Reported By Influenza Type

	Week 50 (December 8, 2013– December 14, 2013)		Cumulative Cases for Weeks 40 – 20 (September 29, 2013 – May 17, 2014)	
Influenza A	8	(100%)	73	(92.9%)
Influenza B	1	(0%)	5	(5.7%)
Influenza A/B	0	(0%)	1	(1.4%)
Influenza (not typed)	0	(0%)	0	(0%)
Total	9*	(100%)	79*	(100.0%)

*Includes results from Rapid Diagnostic Testing, Viral Culture, RT-PCR, Serology, and Immunofluorescence.

Positive Influenza Tests, by Age Group
Week 50 (8 Dec 2013 - 14 Dec 2013)

Positive Influenza Tests by Week
September 29 2013 - May 17, 2014

RAPID DIAGNOSTIC TESTING

Rapid Diagnostic Tests are screening tests used to detect the Influenza virus in a short period of time. While initially less accurate than PCR and viral culture, rapid diagnostics are more accurate as the Influenza season progresses. During week 50, 74 out of a total of 156 tests were performed using rapid diagnostic testing in clinical laboratories. Of these, 7 of the 74 (9.45%) rapid tests tested positive for influenza during week 50. Of the two remaining positive tests in week 50, both were done with RT-PCR.

Week: 50 (December 8, 2013– December 14, 2013)	
No. of specimens tested Rapid Diagnostics	74
No. of positive specimens (%)	7 (9.45%)
Positive specimens by type/subtype	
Influenza A	6 (14.3%)
Influenza B	1 (0%)
Influenza A/B	0 (0%)
Influenza – unknown type	0 (0%)

INFLUENZA-LIKE ILLNESS (ILI) SURVEILLANCE

Sentinel surveillance for ILI consists of three outpatient reporting sites for the District of Columbia. The sentinel surveillance sites report the total number of ILI cases encountered per week and the total number of patients seen at the clinic during that same week. For this system, ILI is defined as the existence of fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a known cause other than Influenza.

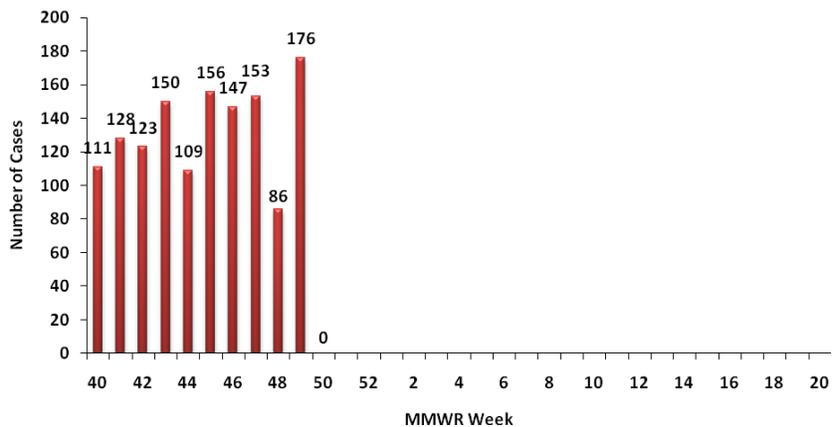

For week 50, no sentinel providers reported data on visits that met the criteria for ILI.

Sentinel Surveillance ILI Activity for Washington, DC

Week of	Activity *
Dec 8 – Dec 14	<i>Sporadic</i>

***No Activity** – overall clinical activity remains low and there are no lab confirmed Influenza cases;
Sporadic – isolated lab confirmed Influenza cases reported and ILI activity is not increased;
Local – increased ILI activity and recent lab confirmed Influenza cases. As the District of Columbia is not a state, this is the highest level of ILI activity it can report.

**Influenza-Like Illness Reported by MMWR Weekly
September 29, 2013 - May 17, 2014**

INFLUENZA TESTING BY THE DISTRICT OF COLUMBIA PUBLIC HEALTH LABORATORY (DC PHL)

The DC PHL subtypes human isolates to monitor the circulating strains of Influenza. The isolates are submitted to the DC PHL by hospitals and commercial laboratories. In week 50, 1 of 2 specimens sent to the PHL have tested positive for Influenza. To date, 45 specimens have been tested, of which there have been 5 positive specimens. All but one of the isolates were subtyped as Influenza A/H1 2009 H1N1, with remaining being subtyped as Influenza A H3.

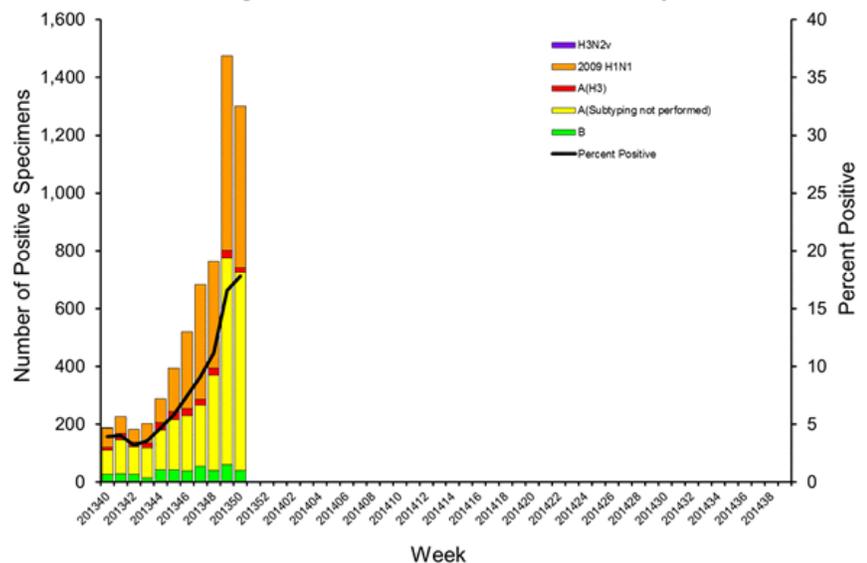

DC PHL Surveillance of Influenza Cases Reported By Influenza Subtype

DC PHL Influenza Testing	Week 50 December 8, 2013 – December 14, 2013	Cumulative Cases for Weeks 40 - 20 October 1, 2013 – May 17, 2014
Number of specimens tested	2	45
◆ Number of specimens positive for Influenza:	1 (50%)	5 (11.11%)
● Influenza A	0 (0%)	4 (100%)
▪ H1 2009 H1N1	0 (0%)	4 (80%)
▪ H1 seasonal	0 (0%)	0 (0%)
▪ H3	1 (100%)	1 (20%)
● Influenza B	0 (0%)	0 (0%)

NATIONAL INFLUENZA ASSESSMENT

The CDC's weekly seasonal Influenza surveillance report for week 50 noted that Influenza activity continued to increase in the United States. The proportion of deaths due to Influenza and pneumonia in the US was below the epidemic threshold. Two Influenza-associated pediatric deaths were reported to the CDC during week 50. One was associated with a 2009 H1N1 virus, while the other occurred during the previous season. For the 2013-2014 season, a total of four pediatric deaths associated with Influenza have been reported in the US. During week 50, 7,294 specimens were tested, of which 1,301 (17.8%) were positive. Of the 1,301 respiratory specimens that tested positive during week 50, 1,261 (96.9%) were Influenza A, and 40 (3.1%) were Influenza B. Of the Influenza A samples, 559 (44.3%) were 2009 H1N1, 16 (1.3%) were H3, and 686 (54.4%) were not subtyped.

Influenza Positive Tests Reported to CDC by U.S. WHO/NREVSS Collaborating Laboratories, National Summary, 2013-14
