

Influenza Surveillance Report

Division of Epidemiology - Disease Surveillance and Investigation
 District of Columbia Department of Health

2013-2014 Influenza Season
 Week 15 (April 6, 2014 – April 12, 2014)
(All data are preliminary and may change as more reports are received)

SUMMARY

- 13 cases of Influenza were reported by hospitals during this reporting period.
- Zero pediatric-deaths associated with Influenza were recorded during this reporting period.
- For the 2013-2014 Influenza season to-date, 655 positive Influenza cases have been reported.

INFLUENZA SURVEILLANCE FROM HOSPITALS & AMBULATORY CARE FACILITIES

District of Columbia hospitals and laboratories report detailed information on cases of Influenza on a daily basis. However, in accordance with CDC guidelines, only Influenza-associated deaths in cases <18 years of age and Novel Influenza A infections are reportable. Please note that data from hospitals include all cases received by participating hospitals, regardless of residency.

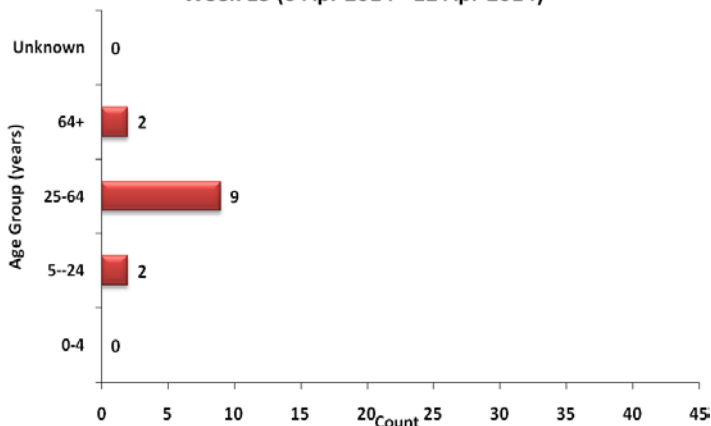

The table below summarizes weekly and cumulative cases of Influenza for the 2013-2014 Season. Data are also presented by age group and by number of cases reported weekly. During week 15 (April 6, 2014– April 12, 2014), there were 13 new cases of Influenza reported. To date, the District has received 655 positive cases reported by hospitals.

Surveillance of Influenza Cases Reported By Influenza Type

	Week 15 (April 6, 2014 – April 12, 2014)		Cumulative Cases for Weeks 40 – 20 (September 29, 2013 – May 17, 2014)	
Influenza A	4	(30.77%)	570	(87.02%)
Influenza B	9	(69.23%)	71	(10.84%)
Influenza A/B	0	(0%)	14	(2.14%)
Influenza (not typed)	0	(0%)	0	(0%)
Total	13*	(100%)	655*	(100.0%)

*Includes results from Rapid Diagnostic Testing, Viral Culture, RT-PCR, Serology, and Immunofluorescence.

Positive Influenza Tests, by Age Group
 Week 15 (6 Apr 2014 - 12 Apr 2014)

Positive Influenza Tests by Week
 September 29 2013 - May 17, 2014

RAPID DIAGNOSTIC TESTING

Rapid Diagnostic Tests are screening tests used to detect the Influenza virus in a short period of time. While initially less accurate than PCR and viral culture, rapid diagnostics are more accurate as the Influenza season progresses. During week 15, 89 out of a total of 144 tests were performed using rapid diagnostic testing in clinical laboratories. Of these, 13 of the 89 (14.61%) rapid tests tested positive for influenza during week 15. The remaining positive test was performed using RT-PCR.

Week: 15 (April 6, 2014– April 12, 2014)	
No. of specimens tested Rapid Diagnostics	89
No. of positive specimens (%)	13 (14.61%)
+Positive specimens by type/subtype	
Influenza A	4 (30.77%)
Influenza B	9(69.23%)
Influenza A/B	0 (0%)
Influenza – unknown type	0 (0%)

INFLUENZA-LIKE ILLNESS (ILI) SURVEILLANCE

Sentinel surveillance for ILI consists of three outpatient reporting sites for the District of Columbia. The sentinel surveillance sites report the total number of ILI cases encountered per week and the total number of patients seen at the clinic during that same week. For this system, ILI is defined as the existence of fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a known cause other than Influenza.

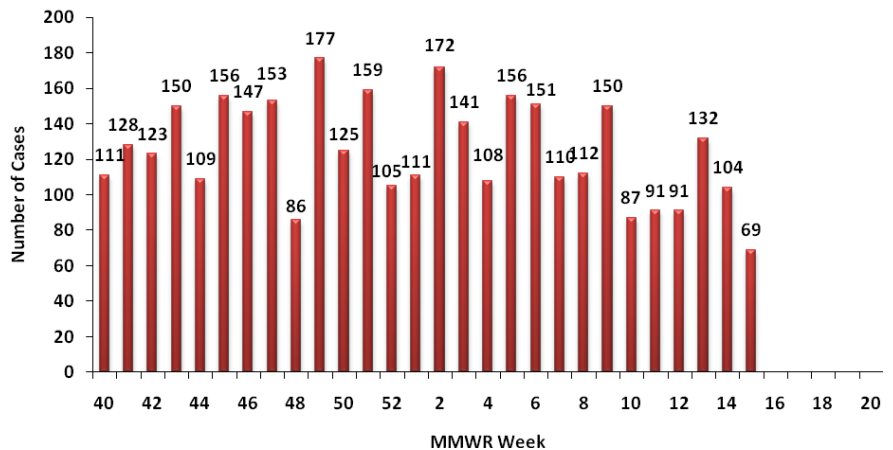

For week 15, sentinel providers reported 69 visits of 730 (9.45%) that met the criteria for ILI.

Sentinel Surveillance ILI Activity for Washington, DC

Week of	Activity *
April 6 – April 12	<i>Local</i>

- *No Activity** – overall clinical activity remains low and there are no lab confirmed Influenza cases;
- Sporadic** – isolated lab confirmed Influenza cases reported and ILI activity is not increased;
- Local** – increased ILI activity and recent lab confirmed Influenza cases. As the District of Columbia is not a state, this is the highest level of ILI activity it can report.

Influenza-Like Illness Reported by MMWR Weekly September 29, 2013 - May 17, 2014

INFLUENZA TESTING BY THE DISTRICT OF COLUMBIA PUBLIC HEALTH LABORATORY (DC PHL)

The DC PHL subtypes human isolates to monitor the circulating strains of Influenza. The isolates are submitted to the DC PHL by hospitals and commercial laboratories. In week 14, 8 specimens were sent to the PHL lab for testing, in which none were positive. To date, 227 specimens have been tested, of which there have been 142 positive specimens. All but 16 of the isolates were subtyped as Influenza A/H1 2009 H1N1, with 11 being subtyped as Influenza A H3 and 5 being subtyped as Influenza B.

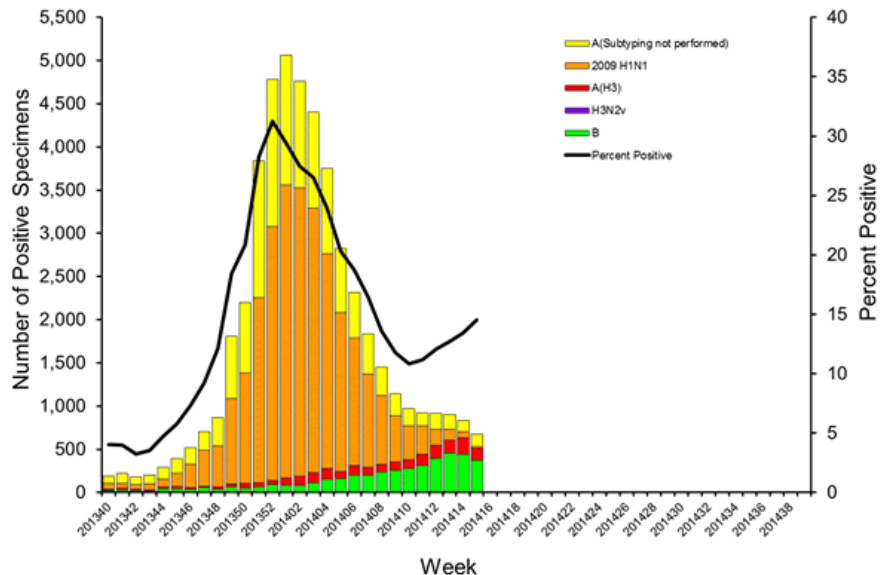

DC PHL Surveillance of Influenza Cases Reported By Influenza Subtype

DC PHL Influenza Testing	Week 14 March 30, 2014 – April 5, 2014	Cumulative Cases for Weeks 40 - 20 October 1, 2013 – May 17, 2014
Number of specimens tested	8	227
◆ Number of specimens positive for Influenza:	0 (0%)	142 (62.56%)
● Influenza A	0 (0%)	137 (96.48%)
▪ H1 2009 H1N1	0 (0%)	126 (91.97%)
▪ H1 seasonal	0 (0%)	0 (0%)
▪ H3	0 (0%)	11 (8.03%)
● Influenza B	0 (0%)	5 (3.52%)

NATIONAL INFLUENZA ASSESSMENT

The CDC's weekly seasonal Influenza surveillance report for week 15 noted that Influenza activity continued to decrease. The proportion of deaths due to Influenza and pneumonia in the US was below the epidemic threshold. One Influenza-associated pediatric deaths were reported to the CDC during week 15, with one associated with an influenza B virus. For the 2013-2014 season, a total of 86 pediatric deaths associated with Influenza have been reported in the US. During week 15, 4,653 specimens were tested, of which 675 (14.5%) were positive. Of the 675 respiratory specimens that tested positive during week 15, 301 (44.6%) were Influenza A and 374 (55.4%) were Influenza B. Of the Influenza A samples, 20 (6.6%) were 2009 H1N1, 138 (45.8%) were H3, and 143 (47.5%) were not subtyped.

Influenza Positive Tests Reported to CDC by U.S. WHO/NREVSS Collaborating Laboratories, National Summary, 2013-14
