

Influenza Surveillance Report

Division of Epidemiology - Disease Surveillance and Investigation
District of Columbia Department of Health

2014-2015 Influenza Season Week 7 (February 15, 2015 – February 21, 2015)

(All data are preliminary and may change as more reports are received)

SUMMARY

- 20 cases of Influenza were reported by hospitals during this reporting period
- Zero pediatric-deaths associated with Influenza were recorded during this reporting period
- For the 2014-2015 Influenza Season to-date, 806 positive Influenza cases have been reported
- The DC PHL tested two specimens for week 7, both negative, for a total of 146 out of 192 (76.04%) specimens testing positive for influenza
- Week 7 of the current 2014-2015 season has been less severe than the last two seasons, but has increased slightly since last week

INFLUENZA SURVEILLANCE FROM HOSPITALS & AMBULATORY CARE FACILITIES

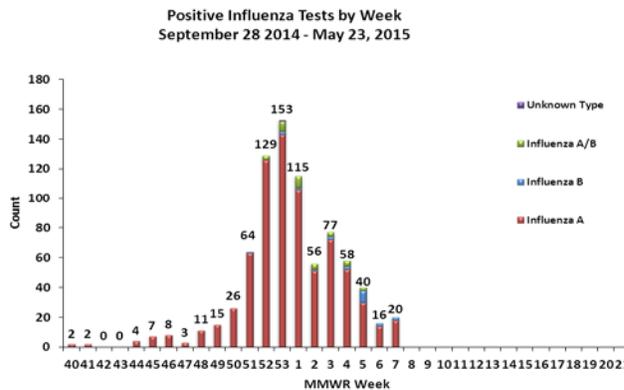

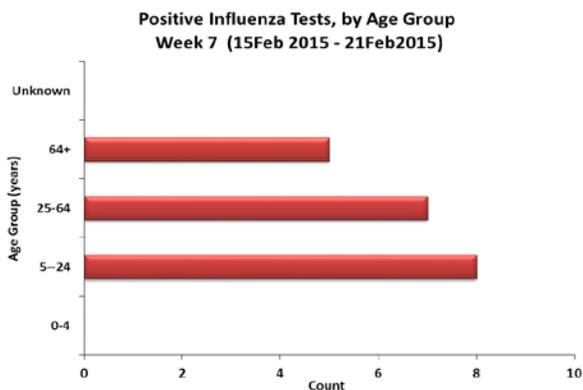

District of Columbia hospitals and laboratories report detailed information on cases of Influenza on a daily basis. However, in accordance with CDC guidelines, only Influenza-associated deaths in cases <18 years of age and Novel Influenza A infections are reportable.

The table below summarizes weekly and cumulative cases of Influenza for the 2014-2015 Season. Data are also presented by age group and by number of cases reported weekly. During week 7 (February 15, 2015– February 21, 2015), there were 20 new cases of Influenza reported. To date, the District has received 806 positive Influenza cases reported by hospitals.

Surveillance of Influenza Cases Reported By Influenza Type

	Week 7 (February 15, 2015– February 21, 2015)		Cumulative Cases for Weeks 40 – 20 (September 28, 2014 – May 23, 2015)	
	Count	Percentage	Count	Percentage
Influenza A	18	(90%)	753	(93.42%)
Influenza B	2	(10%)	21	(2.61%)
Influenza A/B	0	(0%)	31	(3.85%)
Influenza (not typed)	0	(0%)	1	(0.12%)
Total	20*	(100%)	806*	(100.0%)

*Includes results from Rapid Diagnostic Testing, Viral Culture, RT-PCR, Serology, and Immunofluorescence.

RAPID DIAGNOSTIC TESTING

Rapid Diagnostic Tests are screening tests used to detect the Influenza virus in a short period of time. While initially less accurate than PCR and viral culture, rapid diagnostics are more accurate as the Influenza season progresses. During week 7, 136 out of a total of 153 tests were performed using rapid diagnostic testing in clinical laboratories. Of these, 20 (14.71%) positive Influenza specimens were identified during week 7 using rapid diagnostics.

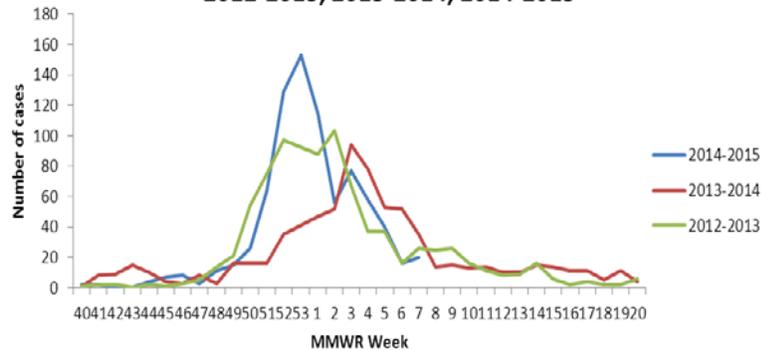

Week: 7 (February 15, 2015 – February 21, 2015)	
No. of specimens tested Rapid Diagnostics	136
No. of positive specimens (%)	20 (14.71%)
Positive specimens by type/subtype	
Influenza A	18 (90%)
Influenza B	2 (10%)
Influenza A/B	0 (0%)
Influenza – unknown type	0 (0%)

WEEK 7 COMPARISON WITH PREVIOUS SEASONS

For week 7, there were 20 cases in the current 2014-2015 season, 35 cases in last year’s week 7, 2013-2014 season, and 26 cases during week 7 in the 2012-2013 season.

As there are 53 weeks in the current season compared to other years, the counts for weeks 53 and 1 of this year have been averaged into week 1. Using this method, cumulatively, there are a total of 672 cases of influenza in the district up to week 7 for the current 2014-2015 season, 555 for last year’s 2013-2014 season, and 651 for the 2012-2013.

Number of Cases as of Week 7 for 2012-2013, 2013-2014, 2014-2015

INFLUENZA-LIKE ILLNESS (ILI) SURVEILLANCE

Sentinel surveillance for ILI consists of three outpatient reporting sites for the District of Columbia. The sentinel surveillance sites report the total number of ILI cases encountered per week and the total number of patients seen at the clinic during that same week. For this system, ILI is defined as the existence of fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a known cause other than Influenza.

For week 7, sentinel providers reported 64 of 952 (6.73%) visits that met the criteria for ILI.

Sentinel Surveillance ILI Activity for Washington, DC

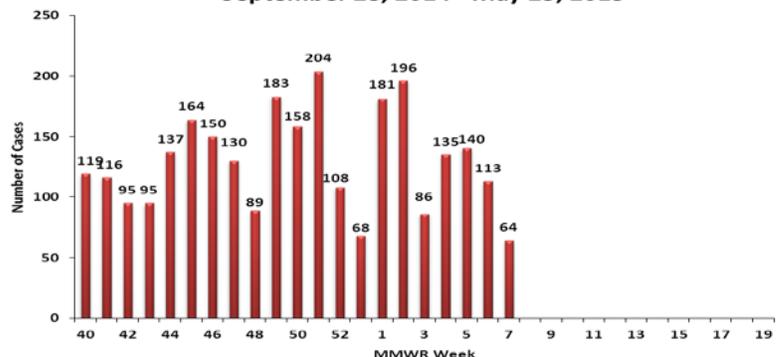

Week of	Activity *
Feb 15 – Feb 21	Local

***No Activity** – overall clinical activity remains low and there are no lab confirmed Influenza cases;

Sporadic – isolated lab confirmed Influenza cases reported and ILI activity is not increased;

Local – increased ILI activity and recent lab confirmed Influenza cases. As the District of Columbia is not a state, this is the highest level of ILI activity it can report.

Influenza-Like Illness Reported by MMWR Weekly September 28, 2014 - May 23, 2015

INFLUENZA TESTING BY THE DISTRICT OF COLUMBIA PUBLIC HEALTH LABORATORY (DC PHL)

The DC PHL subtypes human isolates to monitor the circulating strains of Influenza. The isolates are submitted to the DC PHL by hospitals and commercial laboratories. Two specimens tested negative in week 7, for a total of 146 positive specimens of 192 tested (76.04%), all of which have been influenza A H3.

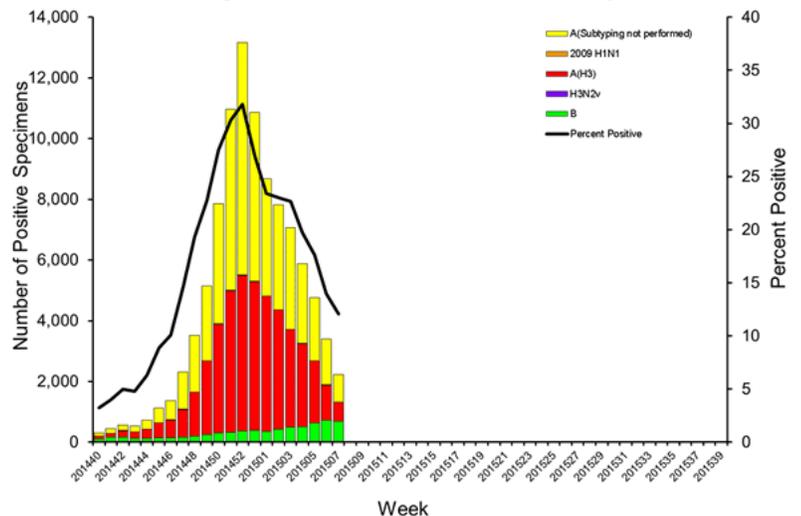

DC PHL Surveillance of Influenza Cases Reported By Influenza Subtype

DC PHL Influenza Testing	February 15, 2015 – February 21, 2015	Total Cases September 28, 2014 – May 23, 2015
Number of specimens tested	2	192
◆ Number of specimens positive for Influenza:	0 (0%)	146 (76.04%)
● Influenza A	0 (0%)	146 (100%)
▪ H1 2009 H1N1	0 (0%)	0 (0%)
▪ H1 seasonal	0 (0%)	0 (0%)
▪ H3	0 (0%)	146 (100%)
● Influenza B	0 (0%)	0 (0%)

NATIONAL INFLUENZA ASSESSMENT

The CDC's weekly seasonal Influenza surveillance report for week 7 noted that Influenza activity decreased, but continued at elevated levels in the United States. The proportion of deaths due to Influenza and pneumonia in the US was above the epidemic threshold. Six Influenza-associated pediatric deaths were reported to the CDC during week 7, of which three were associated with an A(H3) virus, two associated with an un-typed A virus, and one associated with an influenza B virus. For the 2014-2015 season, a total of 92 pediatric deaths associated with Influenza has been reported in the US. During week 7, 18,505 specimens were tested, of which 2,236 (12.1%) were positive. Of the 2,236 respiratory specimens that tested positive during week 7, 1,545 (69.1%) were Influenza A and 691 (30.9%) were Influenza B. Of the Influenza A samples, 7 (0.5%) were 2009 H1N1, 623 (40.3%) were H3, and 915 (59.2%) were not subtyped.

Influenza Positive Tests Reported to CDC by U.S. WHO/NREVSS Collaborating Laboratories, National Summary, 2014-15
